AQUIS complies with GMP Guidelines.

In order to ensure that AQUIS meets GMP guidelines in pharmaceutical manufacturing facilities, the company follows the following procedures to ensure compliance with these guidelines when installed the AQUIS CPR System.

The AQUIS coating work is done in the air handlers and not on the pharmaceutical manufacturing equipment. AQUIS work is done in a clean and hygienic environment. To ensure the environment is controlled AQUIS seals off duct work on the return and supply sides of the air handler to isolate the work space. Air scrubbers with carbon and HEPA filters are also utilized. In addition, the AQUIS coating system is zero VOC and very low odor.

The AQUIS coating system is manufactured in an ISO 9001 facility to ensure quality and consistency. Samples are taken during each manufacturing run and tested to ensure all products meet the design requirements. All AQUIS employees are thoroughly trained to ensure they meet GMP guidelines.
